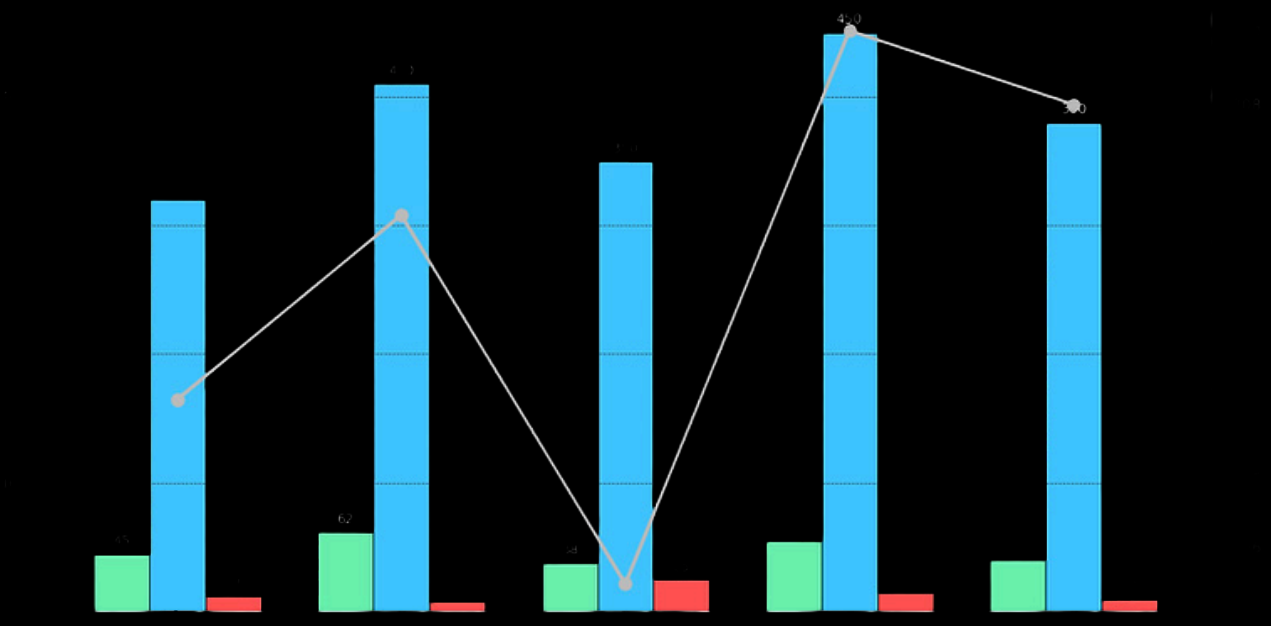
ACTONIX

FILE SERVER AUDIT

ACTONIX

File Server Governance

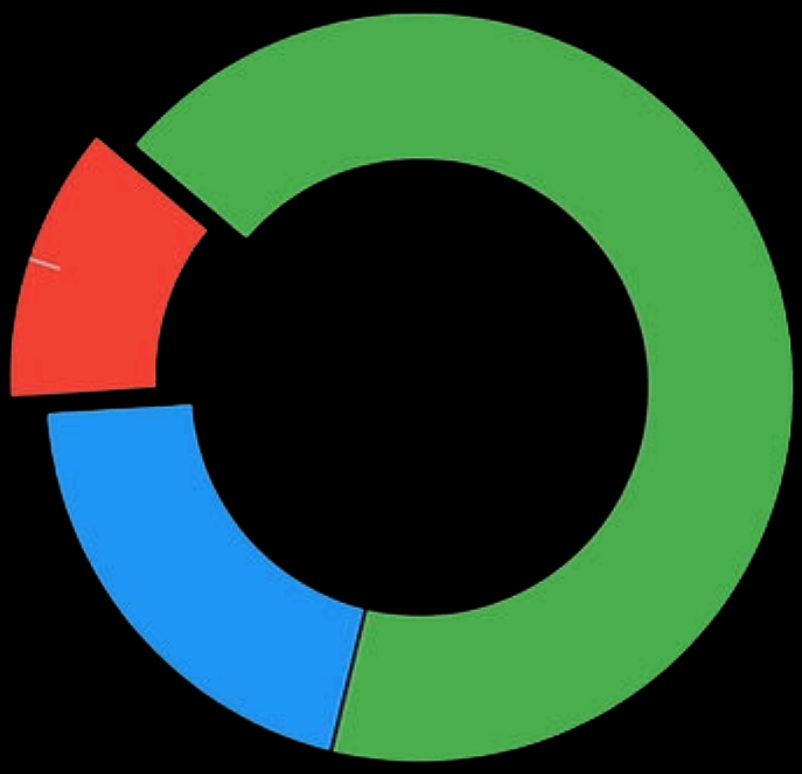


Gain complete transparency with detailed audit trails and pre-set reports tracking who did what, when, and where. Our 50+ automated checks continuously monitor interactions—including file deletions, access attempts, copy events, and modifications—to detect configuration drift instantly

Identify risky changes and trigger automated remediation to restore hardening templates and security baselines. Stop unauthorized permission shifts and dangerous misconfigurations before they escalate into critical incidents or data breaches.

ACTONIX

File Folder Permission State

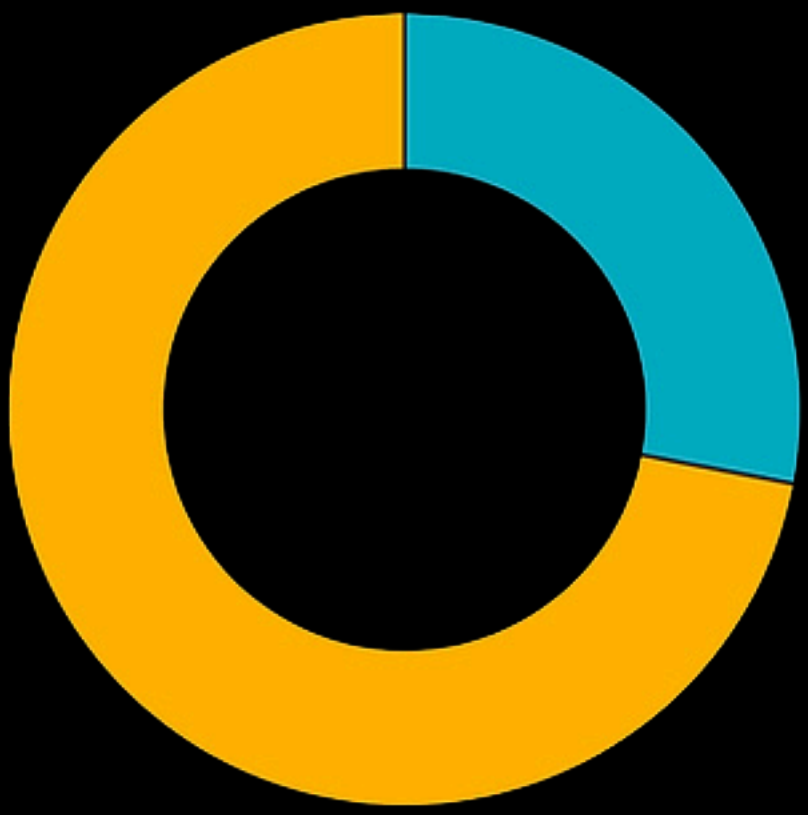


Gain complete visibility into user access—knowing exactly who has permission and where it originates. Spot open shares and excessive permissions to sensitive data.

Reduce your threat surface by tracking all folder interactions, including failed read attempts. Identify unauthorized activity through detailed audit trails (who, what, when, where) and restore your hardened security baseline before vulnerabilities become incidents.

ACTONIX

Stale Data

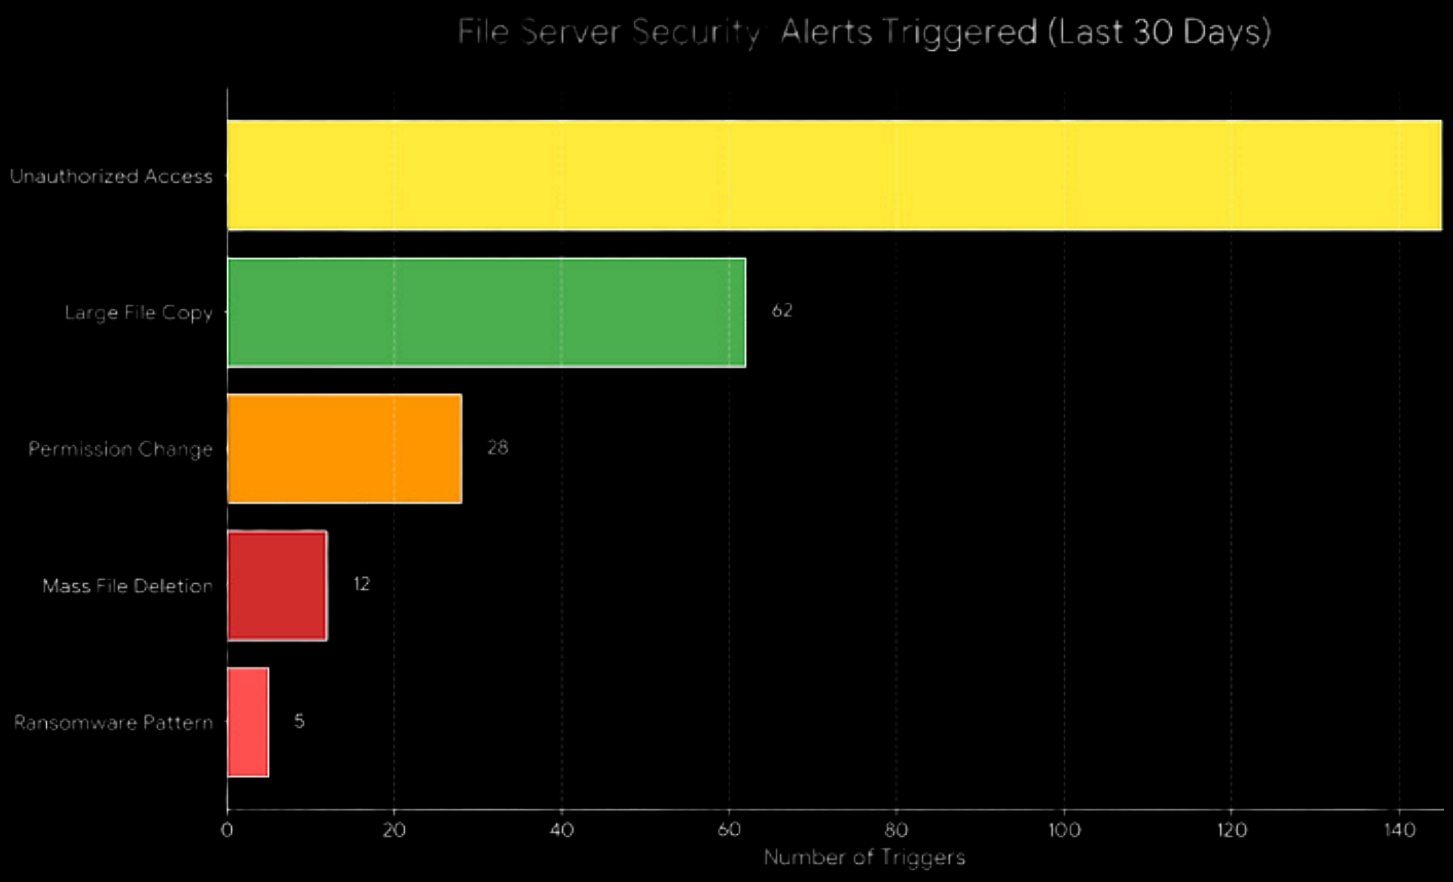


Locate and purge redundant, obsolete, and trivial files to optimize storage effortlessly.

Our automated checks continuously discover stale data, identifying who has access and where it originates.

ACTONIX

Critical Alerts



Detecting ransomware requires an immediate "break-glass" response. When an infection triggers, it often behaves by rapidly renaming files or creating unusual extensions (like .crypt or .locked).

Set up critical alerts for high-frequency file modifications within short timeframes. If a single user account modifies 100 files in 60 seconds, your system must trigger an automated lockout..
