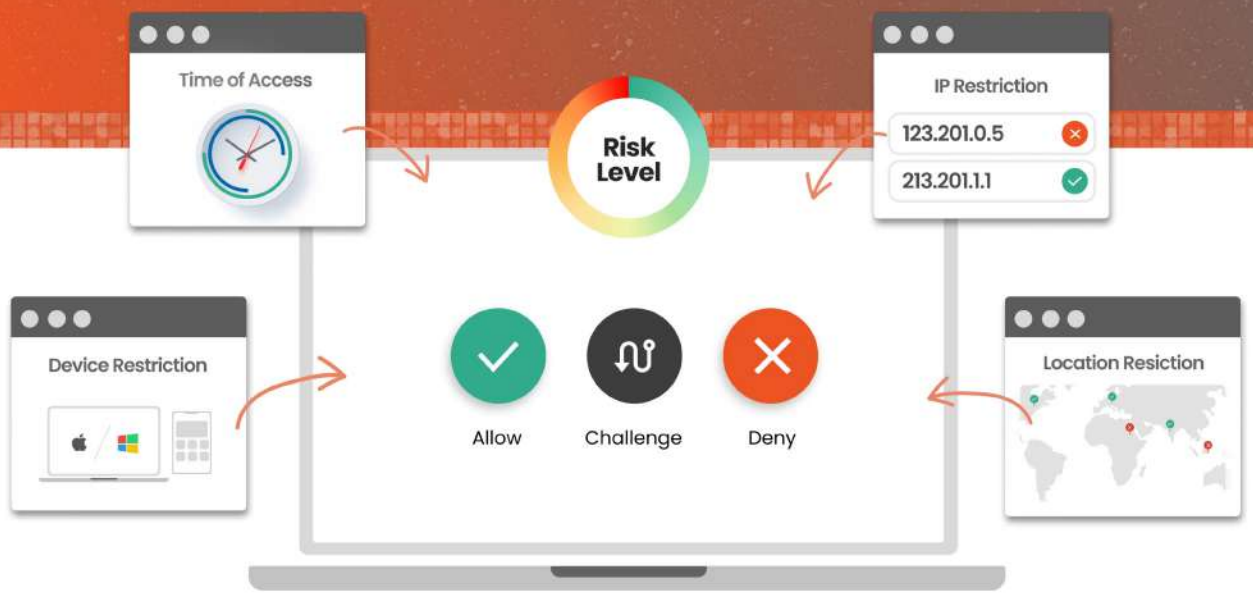
Product Datasheet

Adaptive MFA

miniOrange

Set dynamic access restriction policies based on your user behavior for better security

miniOrange's Adaptive Authentication engine is a highly powerful system of restricting your user's access to applications based on a variety of configurable metrics such as Location, Time, IP Address, Device of access, etc.



Unique Use Cases

IP Restriction for GSuite and Office365 Suite of Apps

Time-based restriction for employee work-life balance.

Allowing organizations to control and limit user access.

Allow or Deny access to resources based on IP, Device, Location & Time

Product Features

IP Restriction

In Adaptive Authentication IP-based restriction method, the admin configures and enlists all IP addresses to allow or deny access. When a user attempts to log into one of the adaptive authentication-enabled apps, his IP address is compared to the preset IP list, and the appropriate action is taken depending on the results (i.e. Allow, Deny or Challenge).

Device Restriction

In this method, the admin allows end-users to add a fixed number of trusted devices for their account. Once a person's device has been registered, that person will be able to log in without restriction. If a person's registered device exceeds the admin's total registered device limit, they will be Challenged or Denied, depending on the policy.

Location Restriction

In Location-based Adaptive Authentication restriction, the admin shortlist and configure a list of Geo-locations where they want to allow end-users to either login or deny based on the location set by the admin. When a user tries to login with adaptive authentication enabled, his location attributes are verified against the Location list configured by the admin, and based on this user will be either allowed, challenged, or denied.

Time Restriction

One of the most significant components of Adaptive Authentication configuration is time restriction , which begins with the admin establishing a time zone with Start and End Time. Users are either permitted, refused, or challenged based on the timezone, time range and policies defined.

Future Scope

- We will create a seperate service for Adaptive Authentication which can be easily integrated with our other services such as Plugins, Proxy
- Implement Behaviour Based Restriction with the help of Machine Learning
- Add support For Adaptive Authentication as First Factor
