Product Datasheet

TACACS

Centralized authentication, authorization, and accounting services for your network devices

TACACS (Terminal Access Controller Access-Control System) is a network protocol that is used to provide centralized authentication, authorization, and accounting (AAA) services for network devices.

miniOrange

Centralized Management

TACACS allows you to manage access to network devices from a central location, making it easier to control and monitor access to your network.

Enhanced Security

Provide an added layer of security by requiring users to authenticate before access to network resources. It also supports encrypted communication, which protects against eavesdropping and network attacks.

Auditing and Accountability

Tracks and logs user activity, allowing you to monitor who is accessing your network and what they are doing. This can be useful for compliance purposes and for identifying security breaches.

Flexibility and Compatibility

Allows you to set levels of access for different users, helping customize access to network resources based on user's role/responsibility. Compatible with a wide range of network devices and operating systems

Device Integrations

6000+ apps

cisco | ciena | NETGEAR | f5 | juniper networks | citrix | DELL | FORTINET

Product Features

Authorization

TACACS can be used to grant or deny access to specific network resources or commands based on the user's privileges. This can help to ensure that users only have access to the resources and commands that they need to do their jobs.

Access Control

Allows you to set different levels of access for different users based on their role or responsibilities. For example, you might allow certain users to access certain network resources, while denying access to others. You can also specify which actions users are allowed to perform, such as configuring network settings or running certain commands.

Multi-Factor Authentication

Helps to protect your network against unauthorized access, as attackers will need to have access to multiple forms of authentication in order to gain access to your network. It is important to carefully evaluate the security needs of your organization and determine the appropriate level of MFA to implement.

Accounting

TACACS can be used to track and log user activity on network devices. This can help administrators to monitor and audit access to devices and to identify any unauthorized access or misuse.

Integration with other systems

TACACS can be integrated with other systems, such as LDAP or Active Directory, to provide a single sign-on solution for network access.

Benefits

- 24/7 Customer Support
- Competitive Pricing
- 1,00,000+ Active users
- Customized Solutions
- 20,000+ Customers
- 6000+ Integrations
