Product Datasheet

Windows MFA

miniOrange

Microsoft Windows Multi-Factor Authentication (MFA) for logon and RDP prevents the Password Based breaches.

With the pace of password-based security breaches, simply using usernames and passwords to secure a Windows login is no longer an option. miniOrange's Windows Two-Factor Authentication solution for windows logon prevents these sorts of Password-Based breaches and adds an additional layer of security to your Microsoft Windows account login.

Product Features

Modern, Secure Authentication

Login to any workstation easily with multiple Multi-factor Authentication (MFA) options. The changed MFA preference is synced to all workstations in real time.

Enforce MFA based on User Type

Configurable Multi-factor Authentication (MFA) enforcement for different types of users. For example, prompt MFA for Administrator and bypass MFA for Standard Users.

Device Based MFA

Have a single Multi-factor Authentication (MFA) for a particular machine when machines are not domain joined and have generic non unique usernames such as admin, administrator, etc.

Offline MFA

Enforce MFA even if the device is disconnected from the internet. Use soft tokens, authenticator apps and backup codes when machine is offline.

Secure Remote Login

Enforce MFA for RDP Sessions, VPN and VDI (Citrix, Microsoft RDS, VMware Horizon, etc.) systems

Support cross domain scenarios

The user can login to machine using account on any trusted domains (AD joined or Azure AD joined) or using a Windows local account.

We also support

Linux MFA

miniOrange MFA module can be installed on all Linux server operating systems to enable the Multi-factor authentication (MFA) on SSH connection to the servers.

Mac MFA

miniOrange integrates with JAMF Connect and JAMF Pro to enable Multi-Factor Authentication (MFA) on Login to MacOS Operating Systems.

Unique Use Cases

- Cyber Insurance with effective cost
- Branding via custom logos and messages
- Offline MFA in airplane mode
